

Introduction

SIG Syn

Project Syn! Syn?

💡 Syn is a Swedish word and translates to "vision"

Project Syn is a pre-integrated set of tools to provision, update, backup, observe and react/alert production applications on Kubernetes and in the cloud. It supports DevOps through full self-service and automation using containers, Kubernetes and GitOps.

Why?

Managing a fleet of Kubernetes clusters is hard - let's automate that!

Features

Multi-Cluster and Multi-Tenant Management

Keeping track of a fleet of Kubernetes clusters, Multi-Tenant aware.

Features

Full GitOps Operations

GitOps automation with Argo CD and Git repo management.

Features

Tooling Bootstrapping

Getting a cluster part of Syn.

Features

Configuration Management

Customized manifests per cluster and tenant.

Features

Reusable Components

Open Source Commodore Components.

Features

Default Toolset

Set of composed Commodore Components.

Features

Automatically Maintained Components

Component maintenance automation thanks to Renovate.

Features

Secret Management

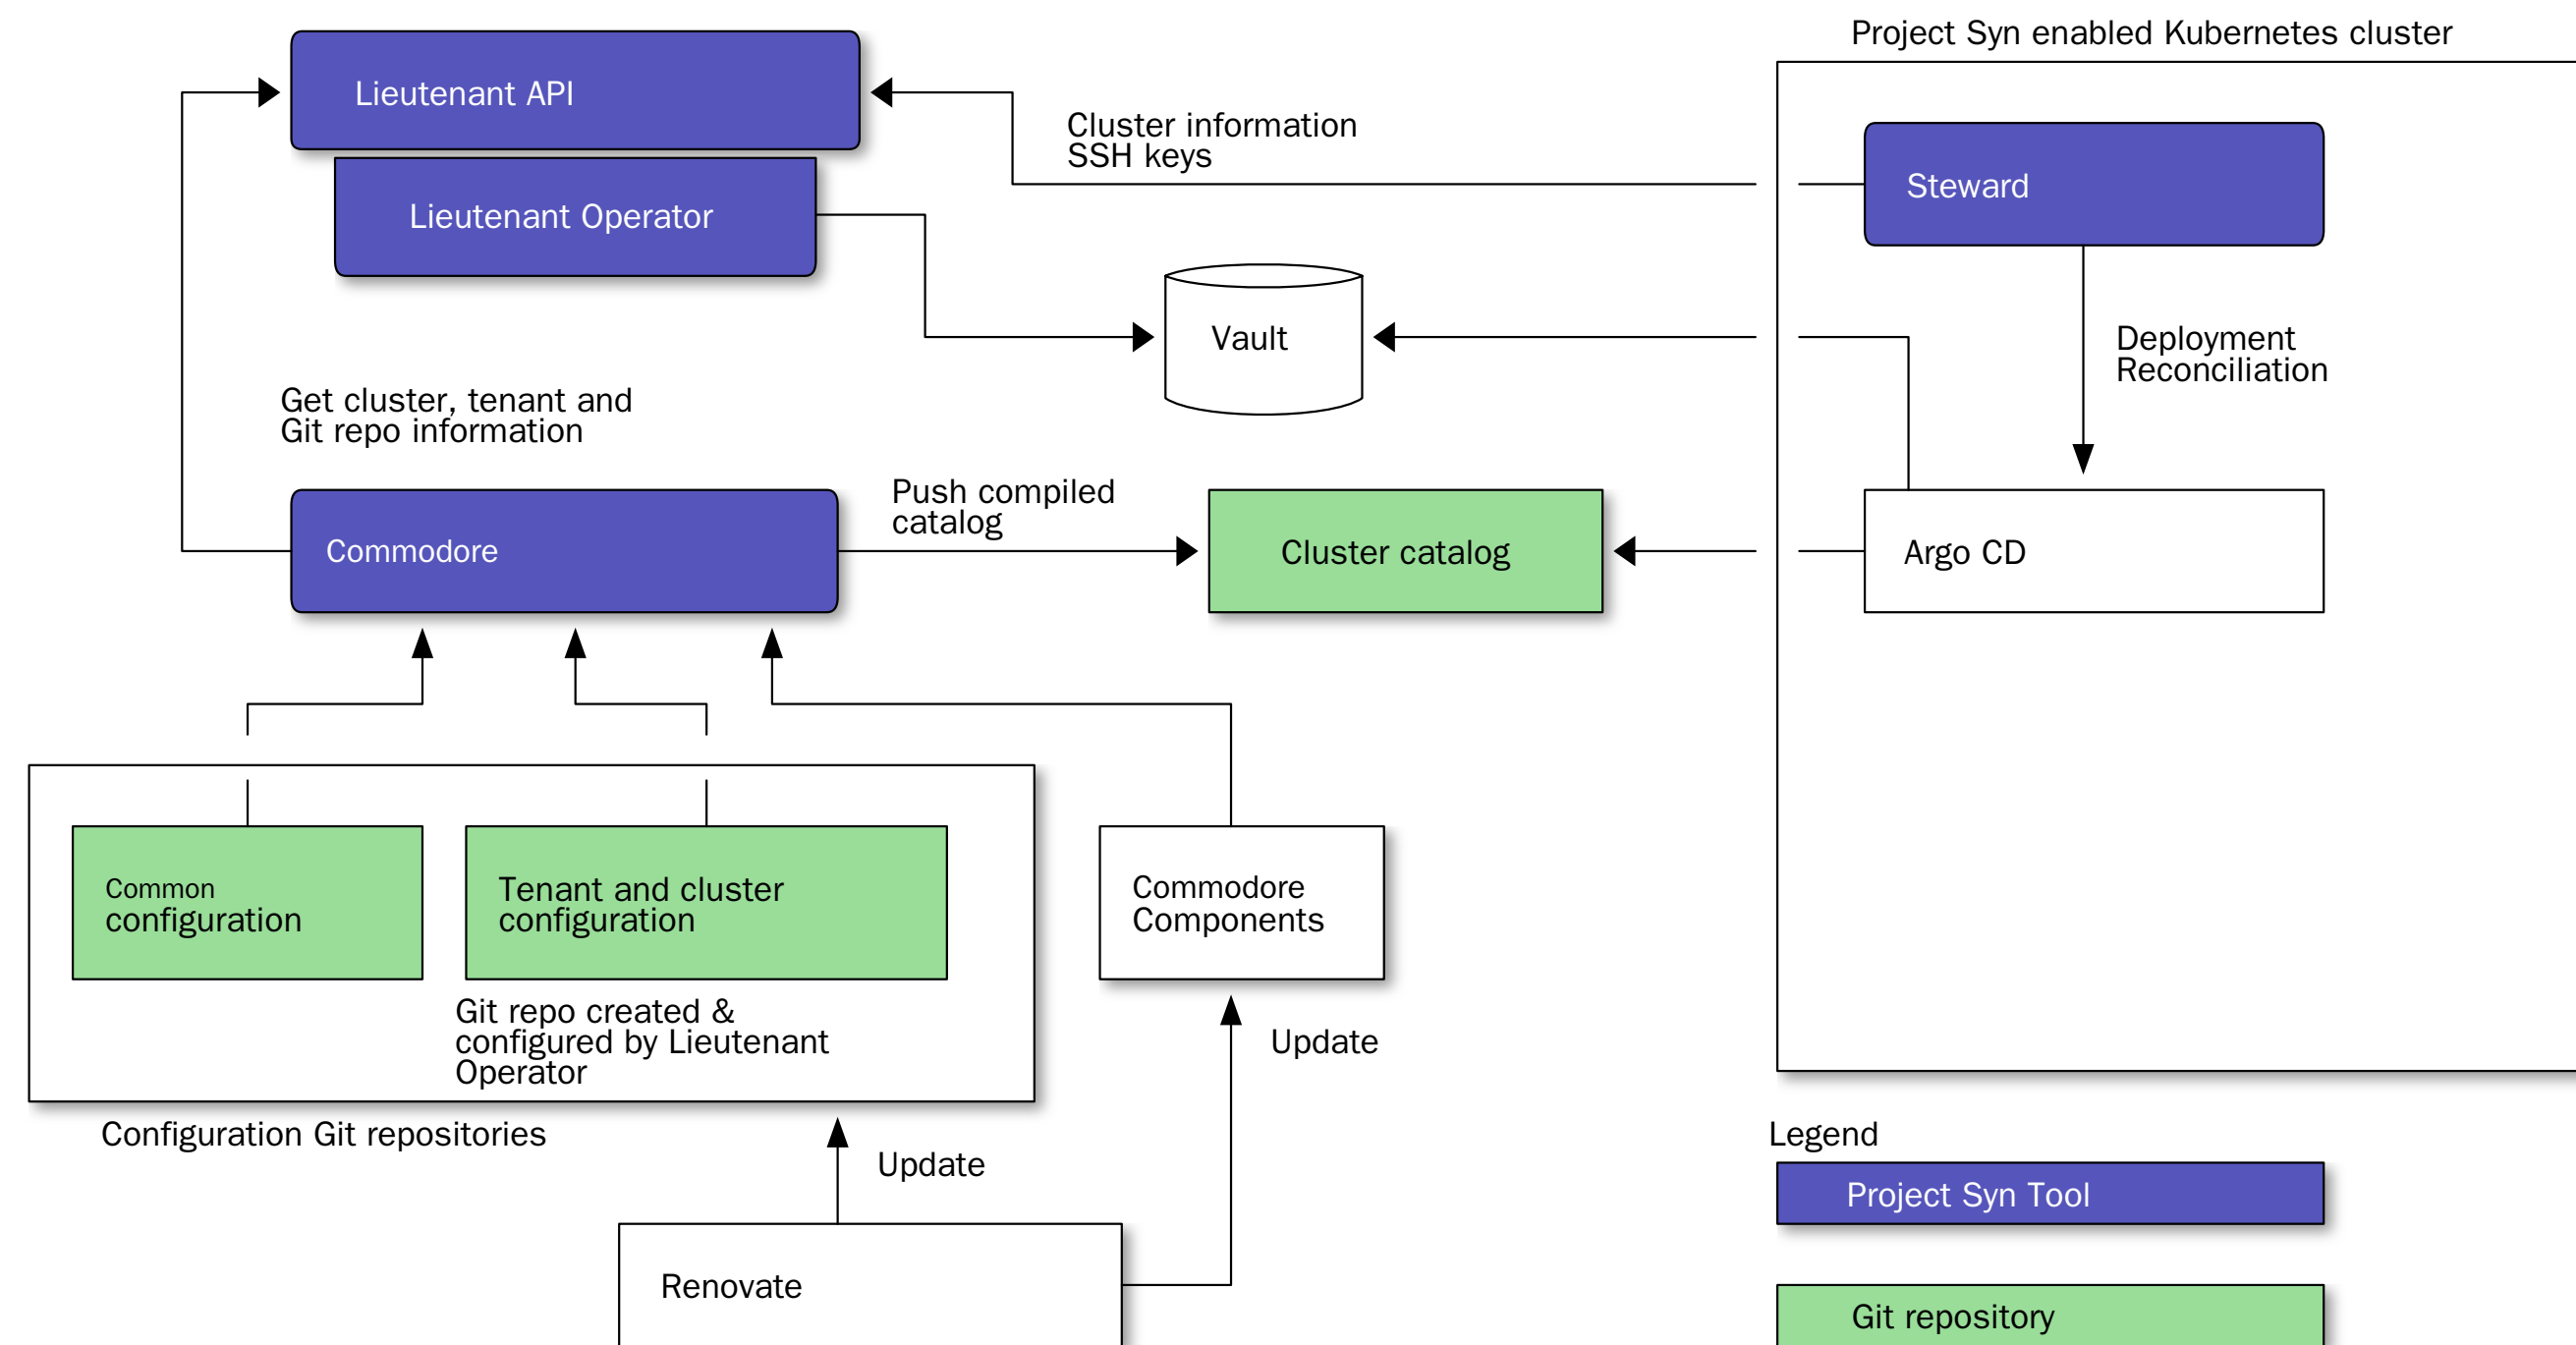

Deep integration into Vault with Kapitan.

Features

Service Provisioning

Application service provisioning fully integrated with Crossplane.

Architecture

Core Project Syn Tools

Lieutenant API

REST API to easily work with cluster and tenant objects.

Lieutenant Operator

Automation of cluster and tenant handling. Git repo management.

Commodore

Cluster catalog compilation engine using Kapitan.

Steward

In-cluster agent.

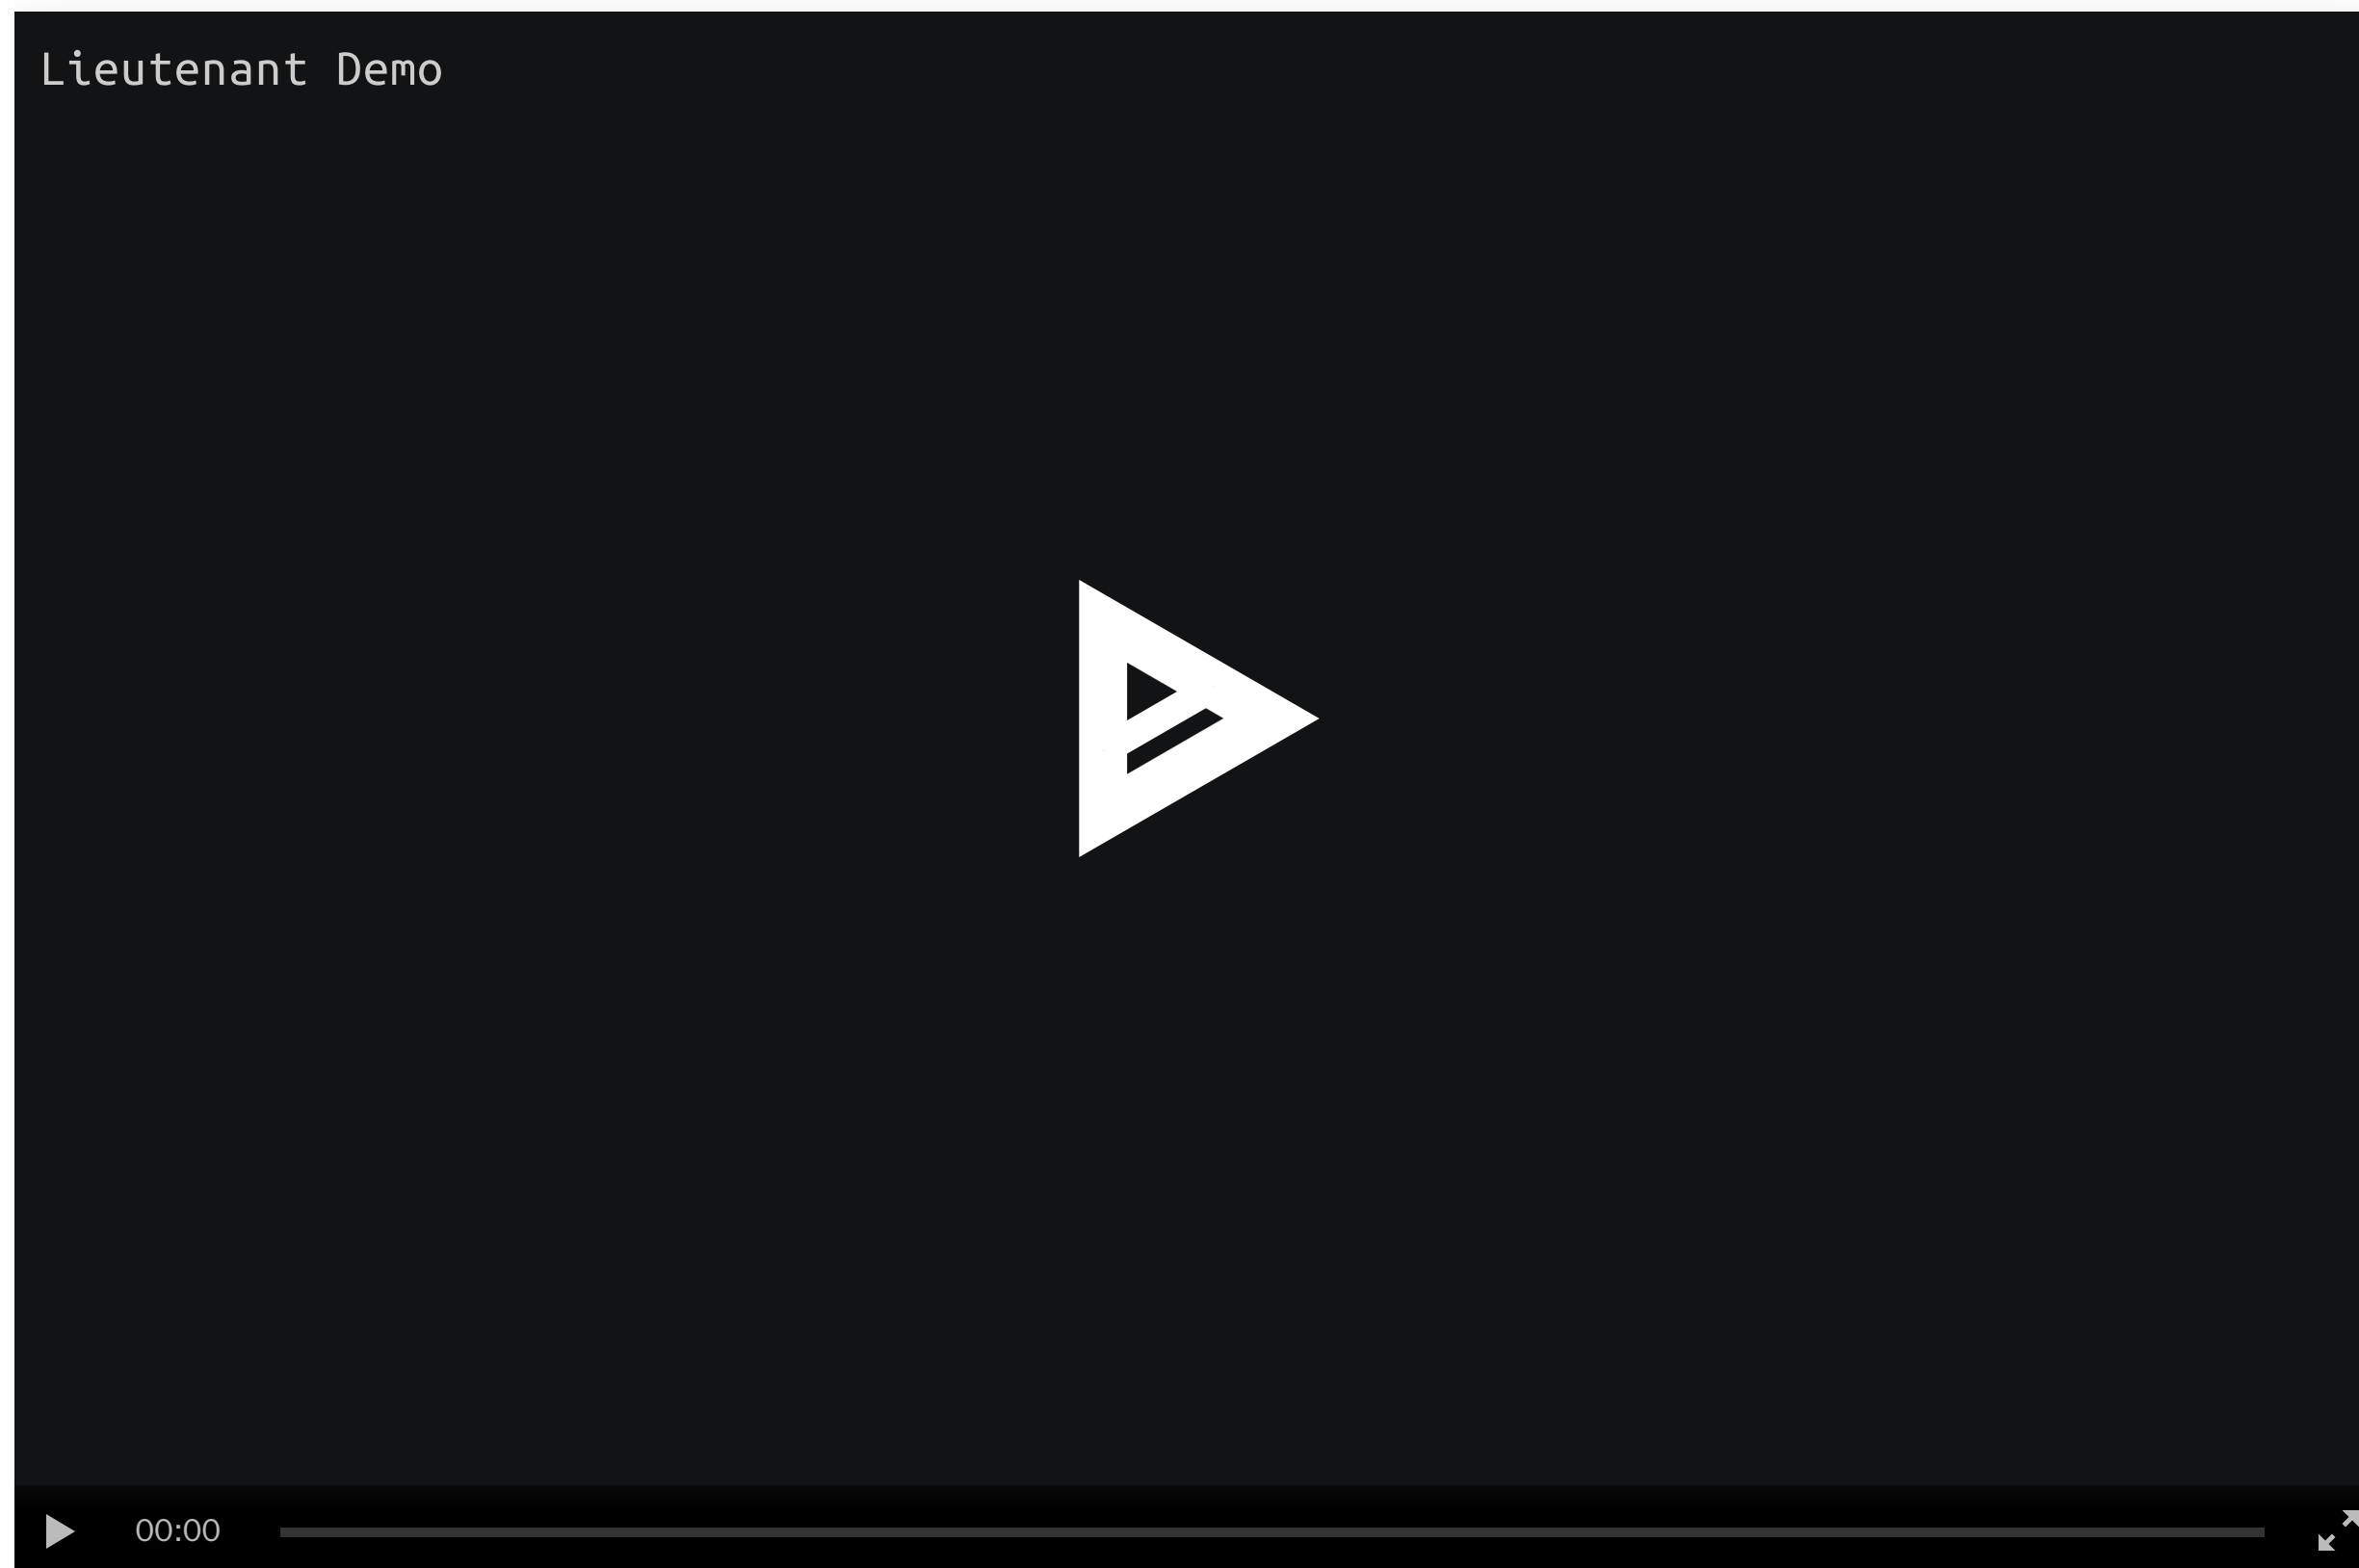

Third-party Tooling

Important tools - integral part of Project Syn:

- Argo CD
- HashiCorp Vault
- Kapitan
- Renovate
- Crossplane
- GitLab

Demo

The demo is based on the [Getting Started](#) guide.
